

- Name all the layers in the network, describe what they do.
 - Input → inputs
 - Convolutional layer → applies filter to all pixels
 - Pooling layer → reduces size of feature map
 - Convolutional layer → applies filter to all pixels
 - Pooling layer → reduces size of feature map
 - Output
- Experiment with the number and size of filters in each layer. Does it improve the accuracy?
 - Yes, but not substantially
- Remove the pooling layers. Does it impact the accuracy?
 - Yes
- Add one more conv layer. Does it help with accuracy?
 - Not really
- Increase the batch size. What impact does it have?
 - Accuracy improved significantly
- What is the best accuracy you can achieve? Are you over 99%? 99.5%?
 - 99%
